

SuccessWare 4.3.8 Release Notes

This version fixes an issue we discovered with automatic credit card processing after the release of version 4.3.7. We highly recommend that all users who use the automatic credit card processing feature upgrade to 4.3.8 as soon as convenient.

The problem was in a check made before processing begins and does not effect automatic processing directly. The check, which was first added in version 4.3.5, makes sure that all of the credit card transactions logged with the processor's (EFSnet) server are recorded in SuccessWare. If they are not, automatic processing is not allowed to start. This prevents the recharging of "old" scheduled payments when a backup data file must be used. Because this check is very important, we very strongly recommend that users who use automatic credit card processing with versions of SuccessWare prior to 4.3.5 upgrade to version 4.3.8 as soon as possible.
